Architectural Decision & Technical Blueprint: Vendor 360 Profile vs. Bookings Overview

1. Architectural Clarification: Are You Mixing Them Up?

Yes, but this is a very natural and common design challenge in multi-vendor platforms. You are comparing two different perspectives of the exact same underlying business data:

- **The Operations Ledger (Bookings Overview):** Transaction-centric. It answers: *'What orders are occurring across Maharashtra today? Which are pending payment, en route, or scheduled?'* Its primary actor is the operations/dispatch team.
- **The Partner Health Dossier (Vendor 360 View):** Entity-centric. It answers: *'How good is this specific shop owner? What services do they sell, what percentage of incoming requests do they decline, and what is their customer rating?'* Its primary actor is the vendor account manager.

2. Deep Comparison: Option A vs. Option B

Evaluation Criteria	Option A: Vendor 360 Profile (Drawer in Users)	Option B: Vendor Filter inside Bookings Tab
Core Concept	Clicking on a vendor opens their dedicated profile (Services catalog + Acceptance % + Decline % + Ratings).	Adding a Vendor selector on top of the Bookings table to show that vendor's orders and active services.
User Experience	**Intuitive & Industry Standard** (Amazon Seller, Urban Company, Zomato). Full visibility into shop health in one view.	**Confusing & Cluttered.** Bookings table is forced to show catalog services and transaction history simultaneously.
Performance Metrics	Clearly calculates: Acceptance Rate (%), Decline Rate (%), Completed Jobs, Total GMV Revenue (■), Customer Reviews.	Only displays row counts for bookings. Cannot cleanly show service durations, pricing tiers, or photos.
Mobile App Connection	Direct sync with Vendor APK: Vendor adds a service or accepts/declines a job $\rightarrow$ instantly updates in Admin.	Disconnected: If a vendor adds a service that has 0 bookings yet, it remains invisible in this view.
Verdict & Rating	**BEST OPTION (Recommended 10/10)**	Sub-optimal (4/10) — Mixes transactions with partner management.

3. The Gold Standard Architecture: Option A + Deep Cross-Link

To give you the most powerful enterprise dashboard without mixing up features, we recommend the **Unified Two-Way Architecture**:

1. **Keep Bookings Overview Clean:** It remains the master ledger for all customer bookings across Maharashtra with search and status pills.
2. **Implement Vendor 360 Drawer in User Management:** In the 'User Management' $\rightarrow$ 'Vendor' tab (as seen in your screenshot), clicking on **Aai's Bakery Owner** slides out a rich inspection drawer with:

- **Partner Dossier:** Shop Name, Contact, Owner Name, KYC Verification badge, Service Radius.
- **Catalog / Services List:** All active services registered by this shop in the Vendor APK (e.g. 'Cake Baking', 'Birthday Catering', 'Special Delivery') with duration and ■ price.
- **Fulfillment Analytics:** Total Requests Received, Acceptance Rate (e.g. 92%), Decline Rate (8%), Completed Orders, and Total GMV (■ earned).

3. **Seamless Cross-Link:** Inside the Vendor 360 Drawer, a single button: *'View All Orders in Bookings Tab $\rightarrow$'* instantly redirects the admin to Bookings Overview filtered to that exact shop!

4. End-to-End Realtime Sync Architecture

Here is how the Vendor Mobile App, Resident Mobile App, and Admin Dashboard stay synchronized:

Component	Action & Event	Database & Real-time Impact in Admin
Resident APK	Customer books a service with date and time slot.	Creates Booking record with status: 'pending'. Increments Vendor's Total Requests counter in Admin.
Vendor APK	Vendor accepts the incoming order from notification.	Updates Booking.status = 'accepted'. Vendor's Acceptance Rate in Admin automatically rises.
Vendor APK	Vendor declines order due to schedule conflict.	Updates Booking.status = 'declined'. Admin Vendor 360 immediately registers the decline in performance analytics.
Vendor APK	Vendor adds a new service in their catalog screen.	Creates VendorService under vendor's businessId. Instantly visible in Admin's Vendor Services list.

5. Technical Implementation Steps

Step 1: Backend API — GET /api/v1/admin/vendors/[id]/profile

Create an endpoint that fetches the vendor profile along with their registered services (prisma.vendorService.findMany) and aggregates booking counts: accepted, completed, declined, cancelled, and sum of earnings.

Step 2: Frontend — Vendor 360 Slide-Over Drawer

In AdminDashboardClient.tsx, make vendor rows in User Management clickable. Clicking opens a sleek modal/drawer featuring three key cards: **1. Business Overview**, **2. Live Services Offered (with prices & durations)**, and **3. Performance Ratio Cards (Acceptance % vs Decline %)**.

Step 3: Two-Way Navigation Bridge

Inside the drawer, add a link *'View Orders in Bookings Tab'* which sets activeTab = 'bookings' and sets bookingSearch = vendor.business.nameEn so the admin can seamlessly audit that vendor's exact orders.

Conclusion: Do not mix vendor catalog management inside the Bookings Overview tab. Keep Bookings Overview dedicated to live operations, and implement Option A (Vendor 360 Detail View) in User Management with a direct cross-link. This is the cleanest, most scalable architecture.
